

Question 1: CPU, Memory and I/O Analysis

* Observed the CPU and Memory usage before and after opening multiple apps using Resource Monitor

* CPU utilization, memory usage and disk (I/O) activity increased as more applications were launched

* The CPU is the primary functional unit responsible for the performance

Question 7 - 8085 Instruction Execution (CNS/Student)

- Executed the 8085 program in GYNUS-8085 and observed the Program counter, Accumulator, and Flag Register after each instruction.
- The Microprocessor followed the fetch → decode → execute cycle to process each instruction sequentially.
- The final result (08H) was stored successfully, confirming the correct execution of the program and instruction cycle.

Question 2: Comparison of Two Computers

m1

m2

- CPU model, base speed, number of cores and logical processor of two computers compared
- 2 computer with the higher processor speed is expected to execute programs faster and support better multi-tasking
- Higher base speed, more core, and more logical processors
